

[1240] File I/O

Reading and Writing local (and remote) files is something most programs do at one point or another.

C# provides several methods for performing File I/O. `StreamReader` and `StreamWriter` are two very easy-to-use File I/O classes for use with text files.

Files can either contain text data or binary data. Because of the increased speed and capacity of hard disks, text files have become more common due to their ease of use.

In this module, we'll look at both reading and writing text files.
